

Grass Full Cranked Hinge (48mm) For Frameless Inset Cabinets

REVEAL TABLES

WHAT IS A REVEAL? When a door swings, it needs a certain amount of clearance at both ends of the door so that anything close (ie. another door or a side panel) does not interfere with the opening door. This clearance gap is called the reveal. The table below shows the minimum amount of reveal needed for this hinge.

FOR INSET DOORS The minimum reveal is very important for inset doors. For inset doors, the reveal is the gap between the edge of the door and the side panel or the edge of the face frame.

HOW TO USE THESE CHARTS

The first table below shows the reveal between the door and cabinet side wall based on bore distance and mounting plate height. The bore distance is the distance from the edge of the door to the edge of the cup that is drilled in the back of the door. See "B" on the chart to the right for further clarification. When doing replacements, measure and match your existing reveal distance and bore distance to verify if this hinge and plate will work for you. Note that this chart has a range listed due to the hinge being adjustable +1mm and -3mm.

The second table below shows the minimum amount of reveal required for this hinge depending on bore distance and door thickness. For new installations, a 3mm bore distance is highly recommended to give you the most amount of adjustment.

Example: If you want a 4mm reveal, you would use the first chart verify how large of a bore distance is required. In this case it would be 3mm. You would then use the second table to determine how thick of a door will allow this reveal. Using your previously acquired bore distance (3mm), you can now determine that any door between 16mm and 24mm thick will work without binding issues.
